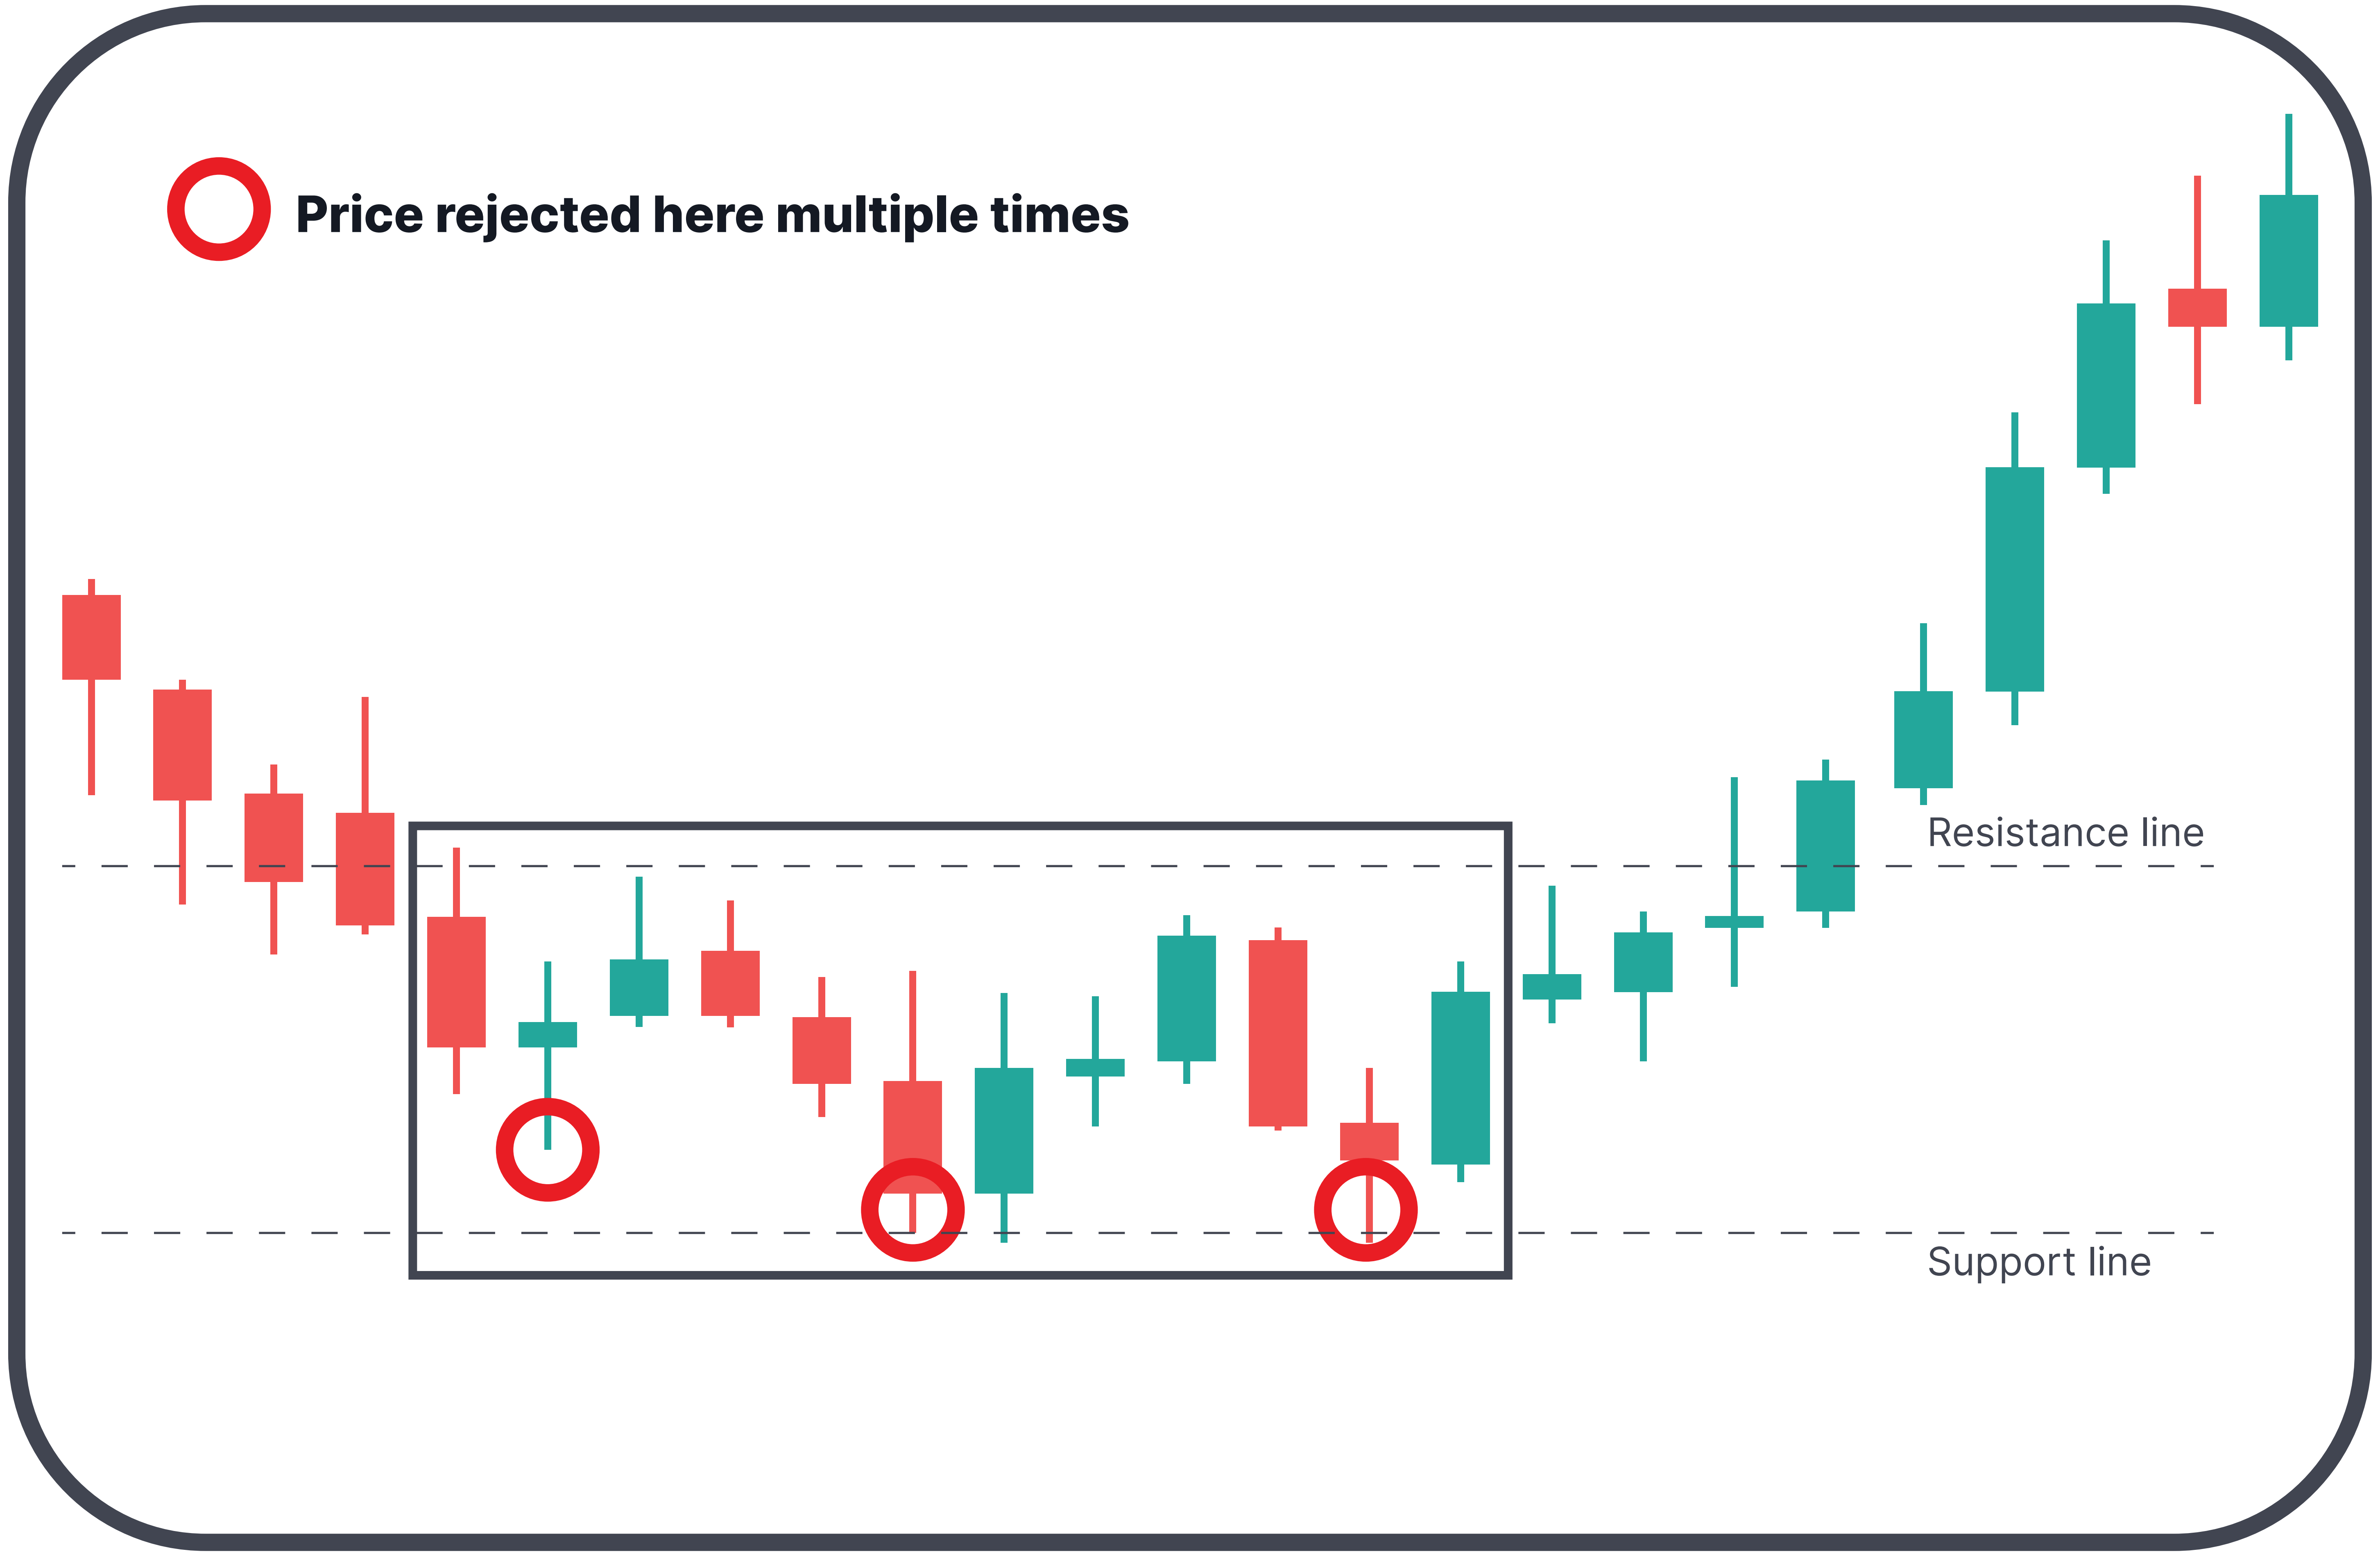
Three steps to identify high probability trading zones

Your capital is at risk. Not investment advice.

Step 1:

Look for decision clusters

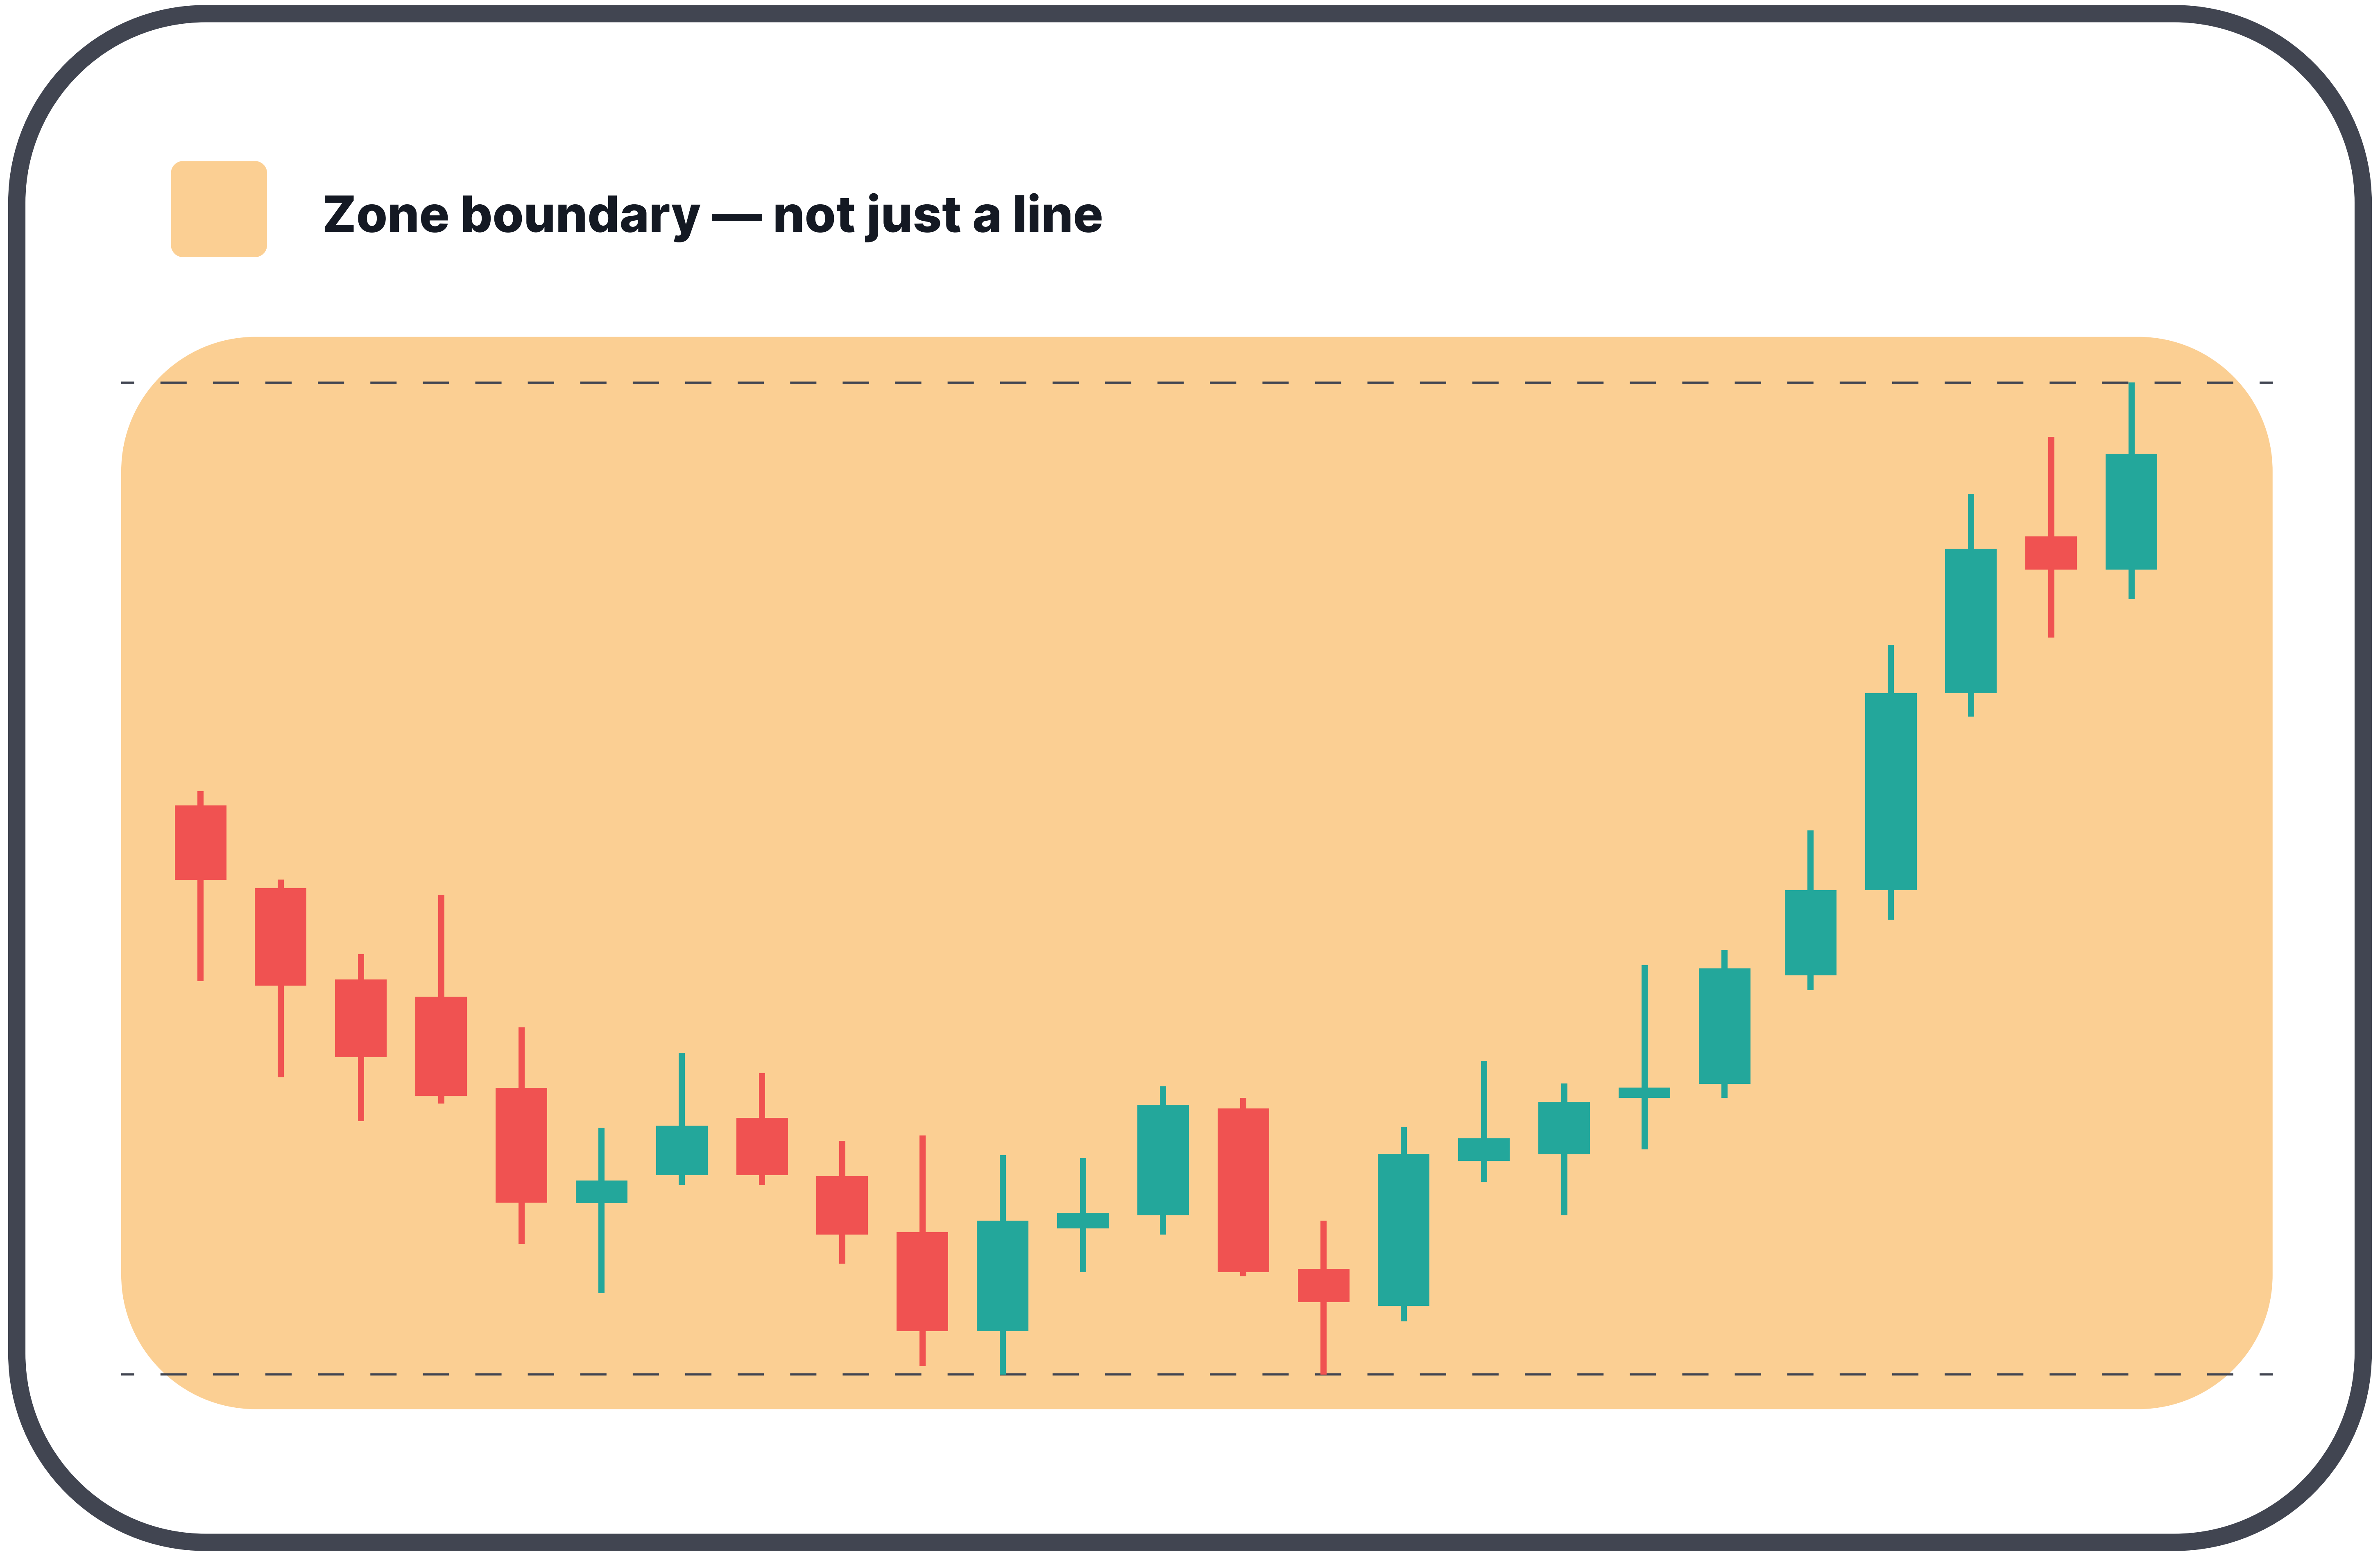
Scan the chart for areas where the price has reversed multiple times. If you see two or more sharp reactions from the same region — not a line, but a band — you've found a zone where decisions were made.



Step 2:

Mark the upper and lower boundaries

Instead of drawing a thin line, mark a range that includes the candle wicks and real bodies from those reactions. Your zone should cover the full area where the price struggled to break through, not just one neat level.



Step 3:

Check volume and context

Zones are stronger when they're paired with a volume spike or appear near major structure (previous highs or lows, swing points, round numbers). The more context you have, the more likely that zone will hold or act as a magnet for price.

The **3-step zone** checklist

- [x] **Decision clusters = 2 or more rejections**
- [x] **Wick-to-wick = Upper + Lower bounds**
- [x] **Volume/context = Reaffirms the narrative**
